

F1b At L = 800 rps the locality-first baseline is broken before the radio degrades

NOT a 65 s server response.
 service = server work per request → p50 99.7 ms (both window)
 corrected = wait since the request was DUE → p50 65 s
 The gap is the load generator's own queue: offered load exceeds capacity, so scheduled requests pile up (l-19).
